

CONCRETE CASTING BUCKET

The CONCRETE CASTING BUCKET is the base unit for an integrated concrete distribution system with completely automatic computer control addressing every concrete distribution requirement. At the bay, concrete is cast by means of buckets connected to a bridge crane by rigid rails. The lifting and lowering of buckets is hydraulically controlled, and can rotate through 90° or 180° to build a casting bed aligned or at right angles with the form. Concrete discharge is hydraulically controlled and custom engineered to fit different forms. The casting bucket is operated by a remote control.
